#### New V-Lock bearings for forestry applications

QM Bearings has developed a new, patented Blue Brute V-Lock bearing that's said to be ideally suited for heavy-duty sawmill and forestry applications that require easy installation and maximum locking capability. It can be installed and removed in about 10 minutes for most applications and doesn't require feeler gauges for checking clearances.

Initially, V-Lock will be available in a range of shaft sizes from 2-7/16" to 3-15/16". Most sizes will be available in pillow block, flange block and piloted flange steel housing styles. A complete selection will be available in March 2006.

Customers may choose from eight primary and secondary seals. Just like other Blue Brute bearings, they can be ordered in many configurations without paying custom bearing prices.
